

FiberCo Analytical Summary: Infrastructure Monetization in 2025

Link Net technical assessment

Prepared by Quratul N.O Thaher, September 2026

Executive summary

FiberCo's network reached 69.6% penetration by December 2025, up from 38.4% in January, with 696 active contract accounts across 1,000 homepasses (319 in January). The apparent July dip, from 64.4% to 58.3%, is a reporting effect: 169 homepasses entered the base that month while active accounts rose from 535 to 583.

Ending temporary exclusivity was net positive. On the nodes XLS held exclusively until 30 June, opening to competition cost XLS three accounts while other ServCos added 89, lifting the total from 60 to 141. The 25% minimum guarantee never bound. Capex recovery is consistent at 4.4 to 9.7 years across nineteen nodes. The exception is F708541 in Jakarta Selatan, at 15.2 years and 44% penetration.

Media bundling is the cheapest available uplift. Bundled accounts generate 85% higher ARPU with no loss of lease revenue, yet attach rates range from 39.3% to 53.5% by region. Closing that gap is worth Rp 1,184,059 a month, over half of it in Jakarta Utara and Jakarta Barat.

Key findings

1. Infrastructure and utilization

Penetration nearly doubled, and the July decline is a reporting artefact. Penetration rose from 38.4% to 69.6% and active accounts from 319 to 696, with growth in all eight regions. In July, 169 homepasses entered the snapshot, expanding the base from 831 to 1,000.

One node is an outlier. F708541 recovers 6.58% of its capex annually, a 15.2-year payback against a network median of 5.4 years. It is also the weakest node on penetration at 44%, with the weakness concentrated in FTTH (37.1%) rather than HFC (60.0%).

2. ServCo performance and competition

The minimum guarantee never bound. XLS exceeded its 25% floor in every month of 2025. At the level it was set, the guarantee gave FiberCo no practical downside protection.

Ending exclusivity increased total activations. On the previously exclusive nodes, XLS went from 60 active accounts in June to 57 in December while other ServCos went from zero to 89, lifting distinct active homes from 60 to 141.

Competition correlates with higher penetration. Homes addressable by more than one ServCo reach 73.3% penetration against 68.0% for single-ServCo homes.

3. Media monetization and profitability

Bundling lifts ARPU 85% with no lease trade-off. Bundled accounts generate Rp 243,506 net ARPU against Rp 131,697 without, while average lease fee is effectively identical (Rp 131,675 versus Rp 131,697).

Catchplay is the most profitable add-on and News Pack is the mismatch. Catchplay has the highest unit margin (Rp 30,000) and volume (97 subscribers), contributing Rp 2,910,000. News Pack has 96 subscribers but only Rp 9,000 unit margin, contributing Rp 864,000.

Regional attach rates vary by 14 percentage points, from Jakarta Pusat at 53.5% to Jakarta Utara at 39.3%. Lifting every region to the best observed rate adds Rp 1,184,059 in monthly margin, 54.6% of it from Jakarta Utara (Rp 416,990) and Jakarta Barat (Rp 229,913).

Strategic recommendations

1. **Drive media attach in Jakarta Utara and Jakarta Barat.** These two regions hold Rp 646,903 of the Rp 1,184,059 monthly opportunity, with no capital required. Shift the News Pack base toward Catchplay or Sport Pack to raise contribution without new subscribers.
2. **Do not renew temporary exclusivity.** Opening exclusive nodes cost XLS three accounts and delivered 89 to other ServCos.
3. **Resolve F708541 before further capital in Jakarta Selatan.** Its 15.2-year payback is nearly three times the median. Run a low-cost activation push. If penetration does not move within two quarters, reassess the node.

Issues and risks

- **Data quality.** 547 home-months show two ServCos active on one homepass (450 on exclusive nodes). Bandwidth_mbps was excluded and 169 homepasses were missing January to June.
- **December churn.** First net decline of the year, 706 to 696 accounts, across six of eight regions. One month, worth monitoring.

Answers to the policy questions

Should FiberCo expand FTTH more aggressively? **Not yet.** HFC leads FTTH by 5.7 points and in 17 of 20 nodes, likely a maturity effect.

Should FiberCo continue the exclusivity policy? **No.** It suppressed activations on affected inventory, and the guarantee never bound.

Should FiberCo encourage more multi-ISP competition? **Yes.** Multi-ServCo homes reach 73.3% penetration versus 68.0%. The 89-account gain is an upper bound given July additions (post exclusivity period)

Should FiberCo adjust its media bundling strategy? **Yes.** An 85% ARPU uplift with no lease cannibalization. MMA's 51.9% attach rate versus TETRA's 40.9% points to ServCo enablement as the constraint.
